... A new TibiaMe bot client for Android devices has just been released by RedBrick Games, the company that owns the rights to the Tibia MMO, and have for a long time now.1. Technical Field The present disclosure relates generally to orthopedic surgical instruments and, more particularly, to a customized instrument for use in orthopedic surgery for shaping bone. 2. Background of Related Art Bone shape or contour is a very important issue in orthopedic surgery, including the installation of artificial joints. In order to ensure long term function of the implant, the contour of the implant must be substantially the same as the natural contour of the bone in which the implant is installed. In the case of hip implants, this involves the contour of the femoral head. In the case of knee implants, this involves the contour of the distal end of the femur. In the case of shoulder implants, this involves the contour of the proximal end of the humerus. The contour of the bone surface can be identified before the implant is installed, using a technique referred to as "shaping", in which the bone surface is shaped toward the shape of the implant. Shaping can be performed before the implant is installed and/or after the implant is installed. The need to match the contour of the implant to the contour of the bone can be particularly important when shaping the bone with relatively little or limited access to the surgical site. In such cases, shaping can be performed through a cannula, or reamer, which is advanced toward the bone surface to be shaped. Prolactin-like peptide affects reproductive function in zebrafish (*Danio rerio*) and induces ovarian germ cell apoptosis in zebrafish embryos. Prolactin-like peptide (PLP) is a secreted protein that affects reproduction in mammals. The effects of PLP on reproduction have not been studied in fish. The present study investigated the effect of PLP on zebrafish reproduction. Microinjection of PLP into zebrafish embryos significantly increased the number of blastomeres. Zebrafish embryos injected with different doses of PLP showed abnormalities during the first week of development. Injection of PLP into adult zebrafish increased the number of mature oocytes. When PLP was co-injected with monoclonal antibody against zona pellucida (anti-ZP), there was 82157476af
